

# Oil Conditioning Unit (OCU)

Off-line filtration for the removal of water or particulate from hydraulic and lube system fluids.

## A cost-effective solution that helps ensure system reliability.

The Parker Oil Conditioning Units (OCU) are a family of off-line filtration packages designed to effectively remove water or particulate contamination from hydraulic and lube system fluids. The high performance, high capacity design enables the efficient removal of the very fine contaminants that cause premature wear in expensive hydraulic components. In addition, the precursors to varnish are also reduced or eliminated completely.

The compact, user-friendly OCUs are a cost effective method of reducing system contamination while helping to ensure the reliability of your hydraulic or lube system.

## Oil Conditioning Unit

The filter design allows the oil to flow under pressure through 114mm of engineered media with three distinct stages of filtration and water absorption.

The largest particles are retained in the top of the element (1), making for an excellent diagnostic tool. Smaller particles are trapped in the mid stage (2), and the smallest particles are trapped in the lower and most compressed part of the element (3).

The cellulose media allows water absorption of up to 200 millilitres within the filter, reducing the water concentration in oil to less than 100 parts per million.

Equally noteworthy is the efficiency of the media in removing resins, metals and oxidation products, all of which are extremely damaging to close-tolerance components.

Manufactured from a specifically engineered cellulose material wound onto a central core, the OCU combines filtration principles to achieve effective filtration – low flow, low pressure and depth loading axial filtration – flow direction from the top to the bottom.

## Features and Benefits

- Solid Partical Filtration
- Water Absorption
- Sludge, Resin, and Oxidation Absorption

### The Parker OCU Benefits

- Removing up to 99% of all Solid Contaminates typically
- Reducing the Water Concentration to Less than 100 ppm typically
- Eliminating Resins and Oxidation Products
- Longer Life for Hydraulic Components

- Significant Reduction of Oil Consumption and Oil Disposal Cost
- Low Cost Full Flow Filter Cartridges
- Reduce Equipment Downtime
- Reduce Operating Cost
- Increase Profit

# Features and Benefits Continued

Tool-less access and easy service via the T-handle.

The combination of chemically treated cellulose and synthetic layers of media presents a massive surface area to remove solid contamination and emulsified water. The result is both exceptional dirt holding capacity and removal of water concentration to less than 100 ppm.

The engineered base design at the bottom of the housing supports the element under high pressure and provides a channelled migration path for clean fluid to flow back into the primary stream.

The Oil Conditioning Unit is designed as a top load filter, but can be mounted at any angle using the heavy-duty mounting bracket.

The intricately channelled base provides a large footprint to fully support the element under pressure, ensuring uniform loading of the element. Ultra-clean oil flows through the channels into the clean oil stream.

## Element Performance

Model OC1				
Media Grade	Part Number	Capacity @ 1.7 bar (25 PSID)	Capacity @ 3.5 bar (50 PSID)	Efficiency
2 Micron	942650	16.2 grams	23.3 grams	B2>400
10 Micron	942652	28 grams	44.3 grams	B10>400

Model OC2				
Media Grade	Part Number	Capacity @ 1.7 bar (25 PSID)	Capacity @ 3.5 bar (50 PSID)	Efficiency
2 Micron	942654	22 grams	45.8 grams	B2>400
10 Micron	942656	36.5 grams	61.6 grams	B10>400

Water absorption for the OC2 element (part number 942682) is typically 900 cc.

Results typical from Multipass tests run per modified test standard ISO 16889 to 3.5 bar (50 PSID) terminal - 100 mg/L BUGL ISO Medium Test Dust was used as per the standard - User results will vary based on system particle distribution.

Dirt Holding Capacity results will typically improve with soft or sub-micron size particles due to reduced surface 'caking'.
